Linear Motor Gantry

HIWIN®
Motion Control and System Technology

Positioning Systems
Customized Positioning Systems

The standardized positioning axes presented in this catalogue make it possible to handle many kinds of positioning tasks. For positioning tasks, that cannot be solved using standard axes, HIWIN engineers are available to work out an optimized solution for customers. The inquiry form at the end of this catalogue serves to help our application engineers make a preliminary design.

A sampling of customized solutions is shown here. In several examples, mechanics are not the only parts customized. For instance, with the planar motors, special software is developed in order to obtain optimal integration of the positioning system to the production process.

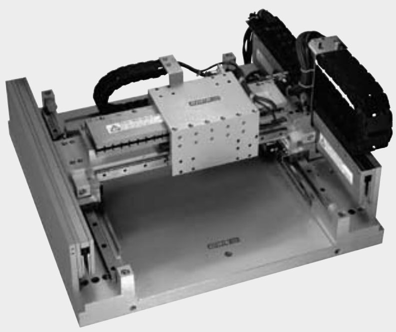
1.1 Examples

Economical Pick & Place and Inspection
XY gantry systems are economical for many applications. Gantry axes are assembled from standard components.

- Standard axes of the LMX1L series
- Repeatability ± 2 µm
- Delivery with base frame

Microshapes and Macroshapes
Milling of microstructures with cutting tools and lasers are application areas in which gantry systems excel. They are also very economical to implement.

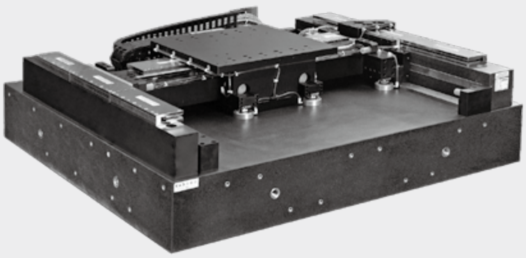
- Coreless motors LMC
- Repeatability ± 2 µm
- Technology proven through countless worldwide installations



Planar Motors
Servo-planar motors provide an excellent technological platform for inspection tasks. During inspection of circuit boards, optical sensors are integrated to completely monitor the printed conductive tracks and SMD components.

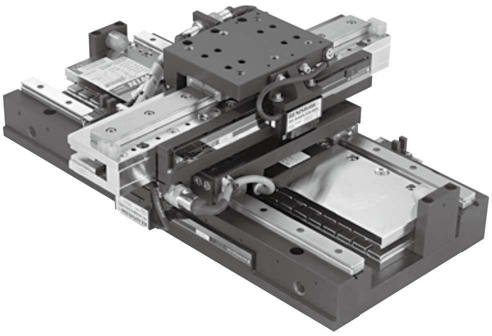
- Virtually no wear due to an air-cushion bearing
- Guaranteed levelness for the complete stroke path (up to 1000 mm x 1000 mm)
- Repeatability ± 3 µm

Positioning Systems
Customized Positioning Systems



Wafer Quality Control and Mask Production at the Highest Level
High precision cross stages with air-bearings are the prerequisites for surface monitoring and mask production, to find even the smallest errors, to produce precision masks, in wafer production for the electronics, chip and flat panel industries.

- Flatness ±2 µm
- Repeatability ±0.5 µm
- Accuracy ±1.5 µm

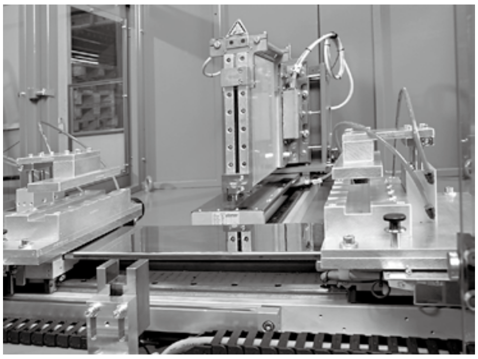


Microsystem Technology and Wafer Processing
Absolute precision and suitability for clean room conditions are the prerequisites for every drive in microsystem technology and wafer processing. Linear motor cross stages meet these requirements.

- Stroke 200 mm x 200 mm, optional 300 mm x 300 mm
- Levelness ± 4 µm across the complete stroke
- Repeatability ± 1 µm across both axes
- Accuracy ± 4 µm across both axes
- Clean room suitability class 100; optional class 10

Laser Scanners
Extremely smooth motion and long operating life are a must for optical inspection systems such as laser scanners. Linear motor stages with air bearings fulfill these requirements.

- Frictionless air cushions
- Coreless linear motors are not effected by cogging.
- Stroke up to 1,500 mm



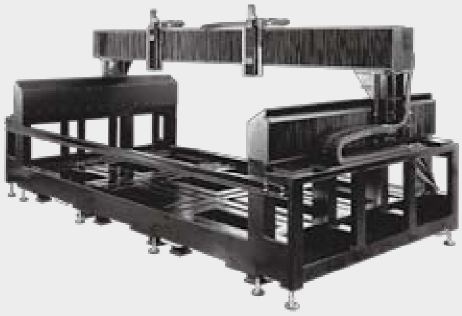
Horizontal High-Speed Hot Weld Machine for Welding Synthetic Materials
Linear motor stages of the LMX1L series with absolute position measurement offer:

- No commutation required at power up
- No “drawing” of the synthetic material when removed from the heated plate
- Welding is controlled by time, force and path
- Lower changeover times due to higher speeds

Water Jet Application

LMS double forcer linear stage provides 2.5m stroke and carries two HIWIN KK stages on the Z-axis. The lower 2 axes are also equipped with LMS high thrust liner motors and run under synchronization.

- No commutation required at power up
- Large stroke
- Delivered with base frame, cover and high end motion controller



Total Solution for AOI Industry

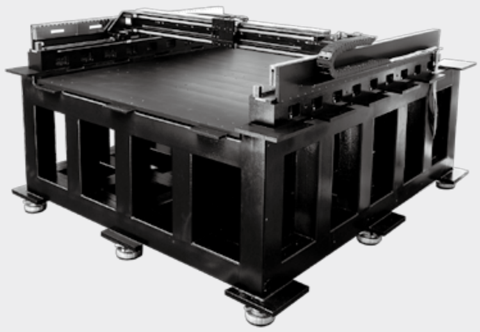
LMC linear stage provides smooth motion for the special needs in AOI applications. With the LMS linear stage mounted to the upper axis, the ballscrew driven Z-axis integrated with a CCD camera can attain high speeds.

- Repeatability ±1 μm
- Velocity ripple below 1.5 %
- Delivery with base frame and cover

Custom Made Stage for Glass Working

The linear motor stage is designed to carry a working head to move above the flat table. The customer's working head is for cutting double layer glasses.

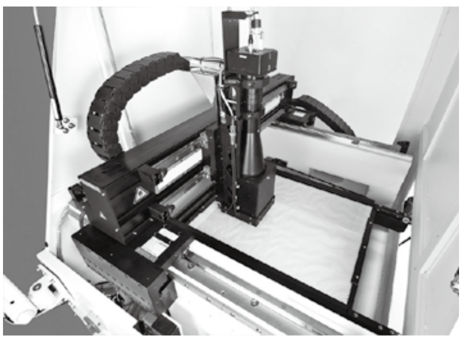
- Gantry structure linear motor positioning stage for Gen. 5 glass
- 1300 mm x 1450 mm stroke
- Smooth motion
- Sinusoidal commutation and no cogging
- LMC series motors
- Repeatablility ± 2μm
- Rigid base structure



Helping Customers with Motion Service

This is another AOI application, where customer need high performance cost ratio.

- 534 x 534 mm^2 stroke
- LMS27 and LMS13 gantry
- Special synchrnous control for gantry
- Steel base frame
- Integrating PCB conveyor, PLC, IPC for customers
- Sub-micron repeatability
- Promising move and settle time 40mm within 200ms to +/-1.5um



Positioning Systems

Customized Positioning Systems

1.2 Glossary

Acceleration
This is the speed change per time unit, i.e., acceleration = speed / time or a = v / t.

Acceleration time
This is defined as the time a drive requires from start until achieving maximum speed.

Accuracy
This, or actually the better terminology, the inaccuracy, corresponds to the deviation between target and actual position. The accuracy along an axis is defined as the remaining difference of target and actual position, after other linear deviations are excluded. Such systematic or linear deviations can be caused by cosine error, angle deviation, ball screw error, thermal expansion, etc. For all target positions of interest in an application, it is calculated with the following formula:
Maximum of sum of systematic target-actual-difference
+ 2 sigma (standard deviation)
Please do not confuse accuracy with repeatablity.

Attraction force F_a
This is created between the primary and secondary parts of the iron-core linear motors which must be taken up by the guide.

Back emf constant
(see also Chapter 1.3, K_v)
This is the ratio of the back emf voltage (rms) to the motor rotational speed or linear speed (rpm or m/s). The back emf is the electromagnetic force, which is created at the movement of the coil in the magnetic field of permanent magnets, e.g. in a servomotor.

Continuous torque, continuous force
(see also Chapter 1.3, F_c)
Or also nominal torque, nominal force. This is the torque or force, that rotary or linear motors can produce in continuous operation (duty cycle = 100%).

Continuous current
(also see Chapter 1.3, I_c)
It is a current that flows over longer time into motor. The maximum allowed current into each coil is also called nominal current. It is characterized when the generated heat results in motor warming of up to 80 °C.

Eccentricity
This is the deviation of the center point of rotation of rotary tables from their position during rotation. It is created by centering and bearing tolerances.

Force, torque
Force (in linear movements) or torque (in rotational movements) is given for defined conditions, e.g., as continuous force or torque at:
- 20 °C ambient temperature
- 80 °C winding temperature
- 100% duty cycle

or as peak force or peak torque.

Force constant K_f
(see also Chapter 1.3, K_f)
This is a coil specific constant. The motor output force can be calculated by multiplying the force constant of the motor by input current: $F = I \times K_f$

Guide deviation
This is the deviation from the axis of stroke. It depends on horizontal straightness (also straightness) and vertical straightness (also flatness).

Horizontal straightness
It is a measure for horizontal straightness when moving in X-axis. If there is deviation in horizontal straightness, there would be positioning error in Y-axis, as the system moves along X-axis.

Motor constant K_m
(see also Chapter 1.3, K_m)
This designates the ratio of generated force and dissipation power and consequently is a measure of efficiency for a motor.

Peak current I_p
(see also Chapter 1.3, I_p)
This current is applied to coils for a short time to generate peak force. HIWIN defines it to be the following: For iron core type motors, I_p is 2 times the allowed continuous current. For coreless types, it is 3 times the allowed continuous current. The maximum time for applying peak current is 1 second. After that, motor has to cool down to nominal operating temperature, before further peak current could be applied again.

Peak torque, peak force F_p
The peak torque (for rotary motion) or peak force (for linear motion) is the maximum force that a motor can generate for approximately one second with peak current I_p. While applying I_p into motor, it is operating near the non-linear range of motor. This is especially useful for acceleration and braking.

Repeatability
Repeatablity may not be confused with absolute accuracy. A linear axis can have medium accuracy, but have good repeatability. Uni-directional repeatability can be measured in a way, that a target position is approached multiple times from an appropriately large enough enough distance and the same approaching direction. In this way, the backlash will not have any effect. For measurement of bi-directional repeatability, the target position is approached from different directions, in which case the backlash will take effect.

Resolution
It is the smallest distance, that the position measuring system will detect. The reachable step size is, in principle, larger than resolution due to other additional factors.

Step size
Also called resolution. It is the smallest possible movement of a system. It depends on encoder, amplifier, mechanical construction, backlash, etc.

Stiffness
This corresponds to the mechnical resistance to deformation a part or an assembly can provide under external static load. (static stiffness) Or, it is the elastic resistance to deformation a part or an assembly can provide under external dynamic load. (dynamic stiffness)

Torque
This is a measurement of the rotational movement in a body and consequently a vectorial direction that can be expressed in the following cross product:
$\vec{M} = \vec{r} \times \vec{F}_1$
The torque is expressed in the equation Nm = kg x m²/s².

Vertical straightness
It is a measure for vertical straightness when moving in X-axis. If there is deviation in vertical straightness, there would be positioning error in Z-axis, as the system moves along X-axis.

Winding resistance R_{25}
This is the coil-specific dimension of is the winding resistance at 25 °C. At 80° C, the winding resistance increases to approximately 1.2 x R_{25}.

Winding temperature T_{max}
(see also Chapter 1.3, T)
This is the permitted winding temperature. The actual motor temperature is dependent on the installation, cooling and operating conditions and consequently can only be determined in a concrete case and cannot be calculated.

Wobbling
It is a term for rotary motor. Wobble is the angular deviation of rotating axis from theoretical axis of rotation as the motor turns. The reason for it is possibly bearing tolerances.

Positioning Systems

Customized Positioning Systems

1.3 Typical Dimensions

1.3.1 Coil-Independent Dimensions

F_a Relatively constant attracting force between motor primary and secondary part. The force is taken by a mechanical guide.

F_c Motor force available as continuous force in nominal operation and results in warming to 70-80 °C.

F_p Short term motor force, which is available at applying I_p to the coils and operate near the non-linear area. Without cooling means, it will cause a very strong temperature rising of coils.

K_m Motor constant, which is the ratio of generated force to dissipation power and is cosequently an index of motor efficiency.

P_v The generated power in a motor coil, which results in time dependent temperature rise according to supplied current and ambient cooling conditions. In the non-linear operating area of current (I_p), P_v is especially high due to quadratic relation to current, whereas in the linear area of current (I_c), it results in relative low warming. P_v can be calculated with motor constant K_m and force as below: $P_v = F/K_m^2$

P_{vp} Peak power at Ip

P_c Continuous power at Ic

T Permissible temperature of motor winding, which is monitored with help of sensor or thermal switch. The motor surface temparature depends on:

- The actual assembly condition (position stage size)
- Heat dissipation condition (cooling means)
- Actual operation

So the actual temperature can only be determined with the above informations.

1.3.2 Coil-Dependent Dimensions

I_c The current for generating continuous force

I_p The peak current for generationg short term peak force

K_f Coil characteristic value for calculation of force with the formula: $F = I \times K_f$

K_v Coil characteristic value, which results armature back emf dependent of velocity when motor works as generator. : $U_g = K_v \times v$

R_{25} Winding resistance at 25 °C; this increases to approx., 1.2 times the value at 80 °C.

2 Linear Motor Stages

Positioning Systems

Linear Motor Stages

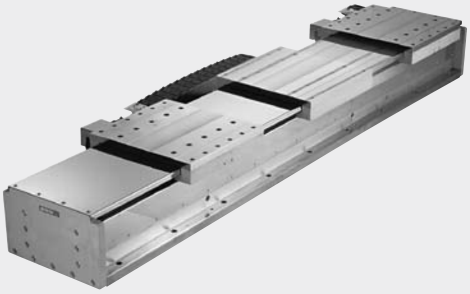
2.1 Product Overview

LMX1E-C Page 14

- Complete linear stage with coreless motor, type LMC
- Excellent for applications with a high degree of synchronous operation requirements
- Also for use as cross table
- Stroke is measured via optical encoder incrementally or absolutely
- Total length to 4,000 mm

LMX1L-S Page 19

- Complete linear stage with iron-core motor, type LMS
- Specially suited for applications with high demands on continuous power
- Also for use as cross table
- Stroke is measured via optical or magnetic encoder incrementally or absolutely depending on requirements
- Total length to 4,000 mm



LMX1L-SC Page 27

- Complete linear stage with iron-core motor, type LMSC
- Sandwich design makes high power density possible without static load of the guideways by attraction force
- Stroke is measured via optical or magnetic encoder incrementally or absolutely depending on requirements
- Total length to 4,000 mm

Cross Tables

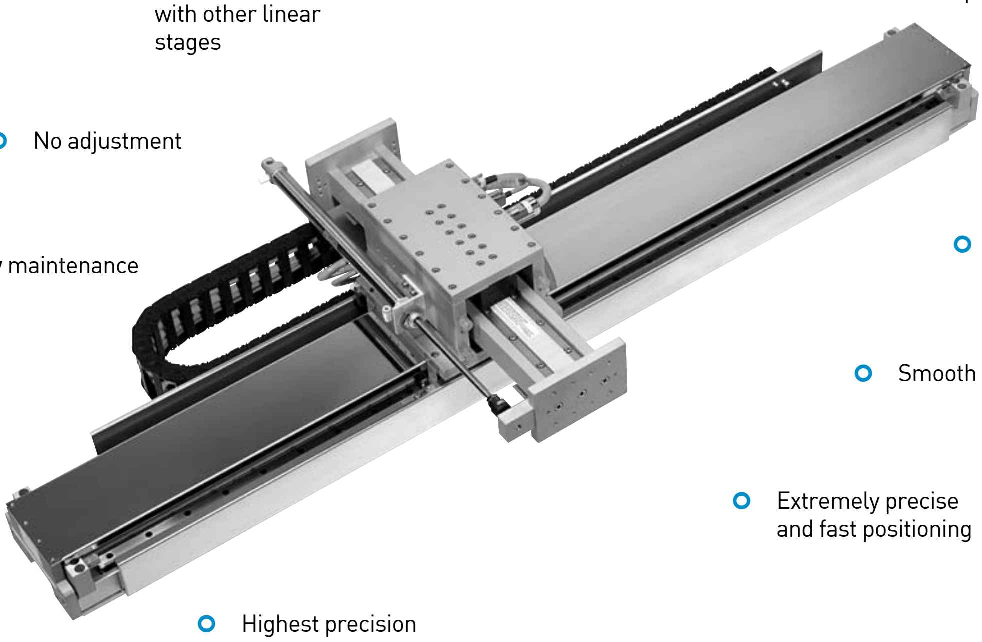
Positioning Systems

Linear Motor Stages

2.2 Typical Properties of Linear Motor Stages

HIWIN linear motor stages are directly driven axes with linear motors, which are designed as a plug and play solution. Standardized cable chains and customized cable guides are possible as an option. They are complete axes with distance measurement system, linear guide way, limit switch and optionally covers as protection against ambient influences. An arresting brake can be added as an option.

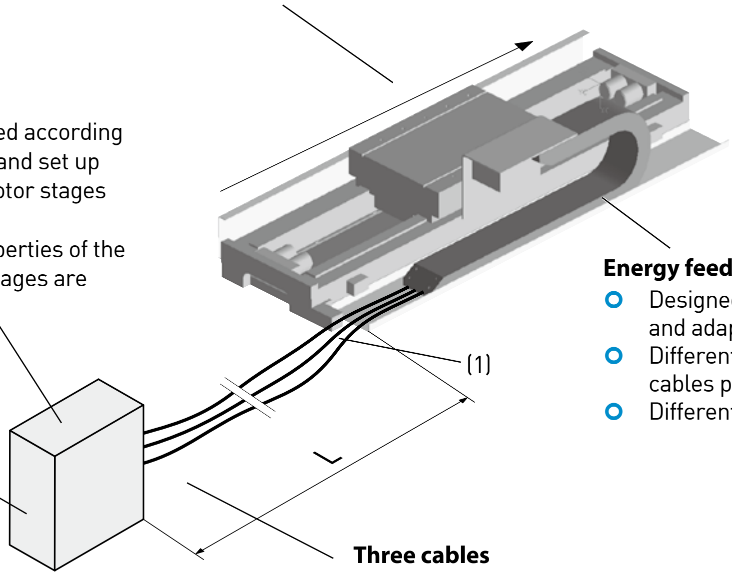
Due to the direct drive, the linear stages are backlash-free, very dynamic, low maintenance and can be equipped with several blocks.
The linear stages are provided as a complete solution including drivers on request. Customers can select the drive manufacturer of their choice. We supply the required electronic parameters for adaptation of the linear motor.



2.3 Scope of Delivery

Positive (+) movement direction
The movement direction is defined via the position of the reference switch.
As a standard, it is on the opposite side as the limit switch plug (1).

Driver
(also refer to page 74)
A suitable driver is selected according to customer applications and set up according to the linear motor stages to be supplied.
The dynamic running properties of the respective linear motor stages are thus ensured.



Energy feed
- Designed to customer specifications and adapted to local conditions
- Different dimensions for additional cables possible
- Different mounting positions possible

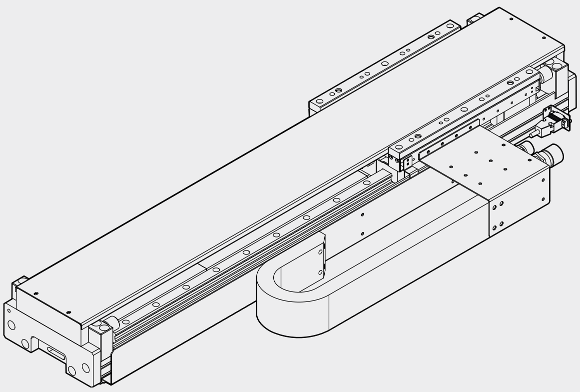
Possible interfaces
- CANopen
- Serial via RS232
- 10 V analog
- Pulse/Direction; CW/CCW
- Others on request

Three cables
- Electric power cable
- Encoder cable
- Limit switch cable

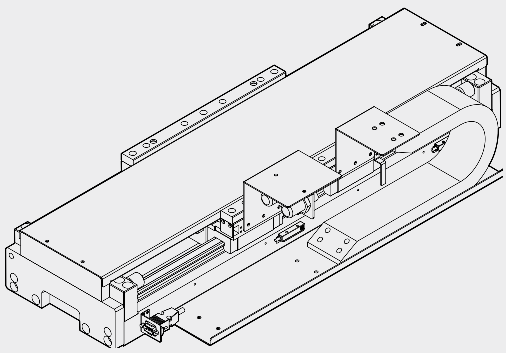
Cable length extending from forcer is 3m, 5m and 7m. the cable are certified according to CE and UL regulations.

Standard linear motor stages
Different models: see pages 14-34.

2.3.1 Cable Chain Orientation



Horizontal orientation



Vertical orientation

Positioning Systems

Linear Motor Stages

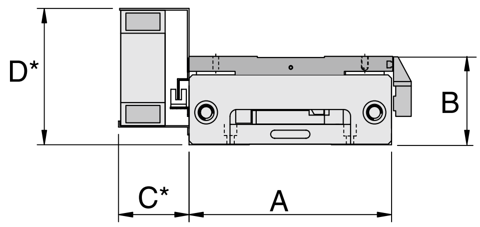
2.6 Linear Motor Stages LMX1E-C

Linear motor stages LMX1E-C are equipped with a coreless motor and well suited for applications with a high degree of synchronous operation requirements. They can also be used in cross tables. They are distinguished by their low profile design. The travel is measured via optical encoder incrementally. The linear motor stages LMX1E-C have very high dynamics and are available in overall lengths up to 4,000 mm.

- Max. acceleration 100 m/s^2
- Max. speed 5 m/s
- Length up to 4,000 mm



* Dimensions C and D are customer-specific

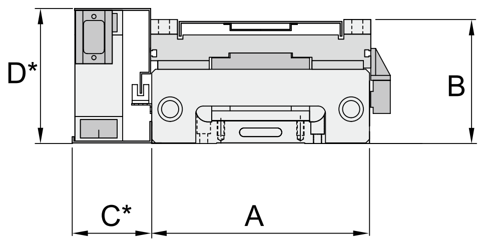
2.7 Linear Motor Stages LMX1L-S

Linear motor stages LMX1L-S are equipped with an iron-core motor, which provides substantial continuous power. They can also be used in cross tables. The travel is measured via optical or magnetic encoders incrementally or absolutely. The linear motor stages LMX1L-S have a very compact design and are availab-le in overall lengths up to 4,000 mm.

- Max. acceleration 50 m/s²
- Max. speed 4 m/s
- Length up to 4,000 mm



* Dimensions C and D are customer-specific

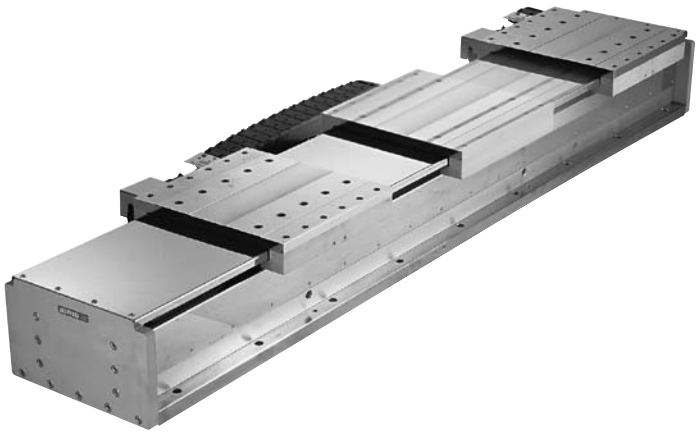
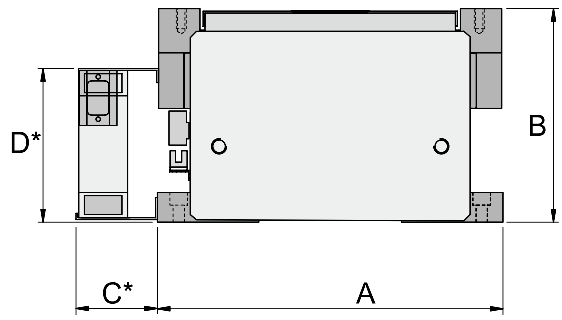
1768	16	1948	18

2.8 Linear Motor Stages LMX1L-SC

Linear motor stages LMX1L-SC are complete axes with iron-core motors. Due to the special design of the motor with arrangement of the forcer between two stators (sandwich construction), the attraction forces are canceled. This relieves the load especially on the guide rails.

- Very high power density
- Due to the sandwich construction of the motor, no attraction forces are created, so that the guides are not subject to static loads.
- The travel is measured via optical or magnetic encoders incrementally or absolutely.
- Total length to 4,000 mm
- Max. acceleration 50 m/s²
- Max. speed 4 m/s





* Dimensions C and D are customer-specific

Specifications for Linear Motor Stages LMX1L-SC

Type (Order code) xxxx=Stroke [mm]	Motor Type	F_c [N]	F_p [N]	Mass of Slider [kg]	Length of forcer [mm]	v_{max} [m/s]	a_{max} [m/s²]	Dimension A [mm]	Dimension B [mm]
LMX1L-SC7 -1-xxxx-G2A0	LMSC7	950	1900	25	300	2*	50	297	223
LMX1L-SC7L -1-xxxx-G2A0	LMSC7L	950	1900	25	300	3	50	297	223

Note: F_c = continuous force, 100% operating time
F_p = peak force (1 s)
Electric parameters for the linear motors: see page 46
* Limited by back emf constant of the motor coil

Positioning Systems

Linear Motor Stages

Installation dimensions for linear motor stages LMX1L-SC

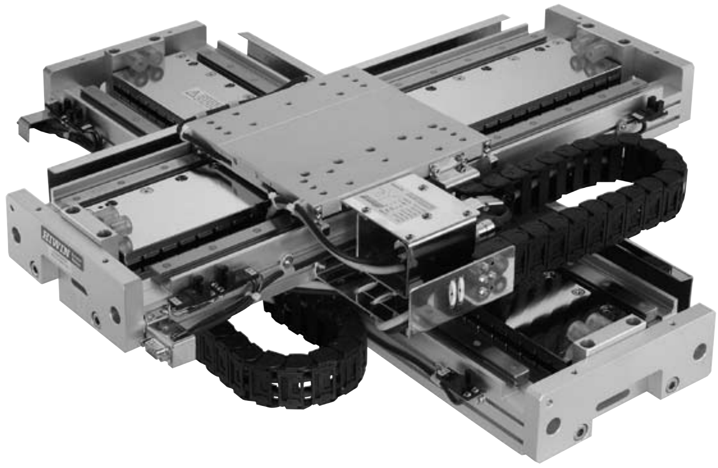
2.9 Cross Tables

The linear motor stages of the LMX1 series can be combined to form cross tables.
The structure of the order number shows that almost every combination of LMX1 linear motor stages is possible.
A cross table with LMX1E-C linear motor stages is shown in 2.9.1.
2.9.2 shows a cross table with LMX1L-S linear motor stages.

2.9.1 Cross Table LMX2E-CB5-CB8

- Equipped with coreless linear motors
- Slight inertia and fast acceleration
- No cogging
- Especially rigid aluminum frame with low profile
- Simple assembly



Specifications for Cross Table LMX2E-CB5-CB8

Type (Order code) xxxx=Stroke [mm]	Orthogo-nality [arc-sec]	Repeat-ability [mm]	v_{max} [m/s]	a_{max} [m/s^2]	Motor Type	F_c [N]	F_p [N]	Mass of Slider [kg]
LMX2E-CB5 CB8-xxxx-xxxx-G20	+/- 10	+/- 0.002	3	50	Upper axis: LMC B5	91	273	2.5
					Lower axis: LMC B8	145	435	Mass of upper axis + 4

Note: F_c = continuous force, 100% operating time
F_p = peak force (1 s)
Electric parameters for the linear motors: see page 48

Positioning Systems

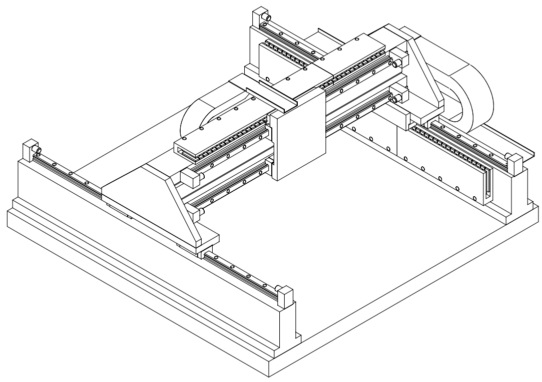
2.10 Gantry Systems

The standardized gantry system of the LMG2A series are systems with one-sided supporting guide rail. The type LMG2A-C is equipped with coreless linear motors. The type LMG2A-S is driven by iron-core linear motors.

2.10.1 Gantry-System LMG2A-CB6 CC8

- Equipped with coreless linear motors
- Slight inertia and fast acceleration
- No cogging
- Rigid aluminum bridge
- Simple assembly

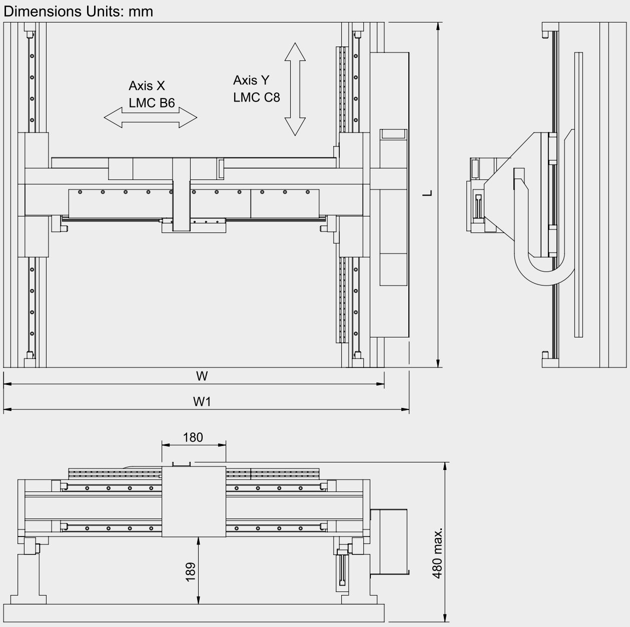


Specifications for Gantry System LMG2A-CB6 CC8

Type (Order code) xxxx=Stroke [mm]	Orthogo-nality [arc-sec]	Repeat-ability [mm]	v_{max} [m/s]	a_{max} [m/s^2]	Motor Type	F_c [N]	F_p [N]	Mass of Slider [kg]
LMG2A-CB6 CC8-xxxx-xxxx-G2	+/- 10	+/- 0.002/0.004	3	50	Upper axis: LMC B6	109	327	3
					Lower axis: LMC C8	195	585	Mass of upper axis + 3.5

Note: F_c = continuous force, 100% duty cycle
F_p = peak force (1 s)
Electric parameters for the linear motors: see page 48

Dimensions of Gantry System LMG2A-CB6 CC8



Dimensions of Gantry System LMG2A-CB6 CC8 with four examples of strokes

Type (Order code)	Stroke X Axis [mm]	Stroke Y Axis [mm]	Dimensions W [mm]	W1 [mm]	L [mm]

3 Planar Motor

Positioning Systems

Planar Motor

3 Planar Motor

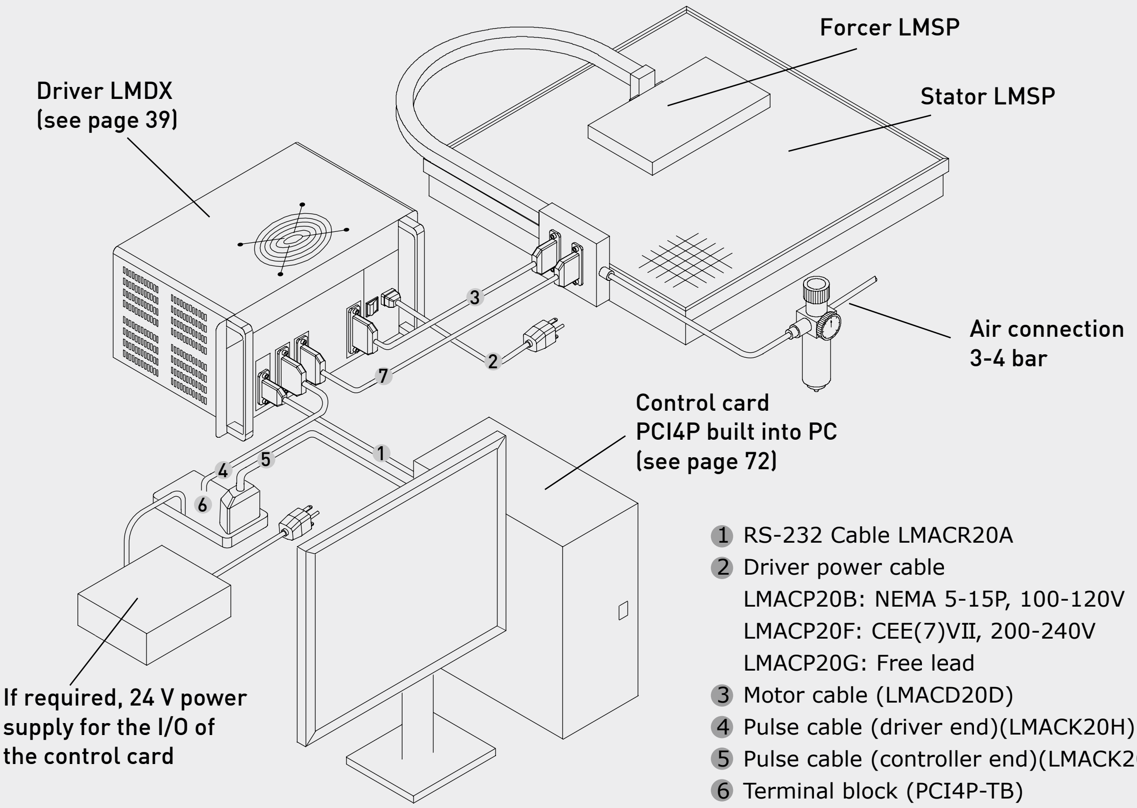
XY movements on an air bearing through a planar-servo motor with integrated distance measurement. Can be operated upside down.

3.1 Planar Servo Motor LMSP

The planar motor LMSP has integrated distance measurement sensors and works with position control (closed loop).

- XY table
- Closed loop thanks to integrated distance measurement
- Air bearing free of wear
- No externally measurable magnetic fields
- Very low heat generation
- Can be mounted upside down
- Stator area up to 1000 x 1000 mm

Configuration of LMSP with servo driver LMDX



1. RS-232 Cable LMACR20A
2. Driver power cable
   LMACP20B: NEMA 5-15P, 100-120V
   LMACP20F: CEE(7)VII, 200-240V
   LMACP20G: Free lead
3. Motor cable (LMACD20D)
4. Pulse cable (driver end)(LMACK20H)
5. Pulse cable (controller end)(LMACK20M)
6. Terminal block (PCI4P-TB)
7. Encoder cable (LMACE20C)

Dimensions of Planar Servo Motor LMSP

(Values X_f see Table 3.1, values X_s see Table 3.2)

3.2 Servo Driver LMDX

The servor driver LMDX for the planar servo motor LMSP is available in two different voltage versions and with an optional digital I/O interface card.

Dimensions of Servo Driver LMDX

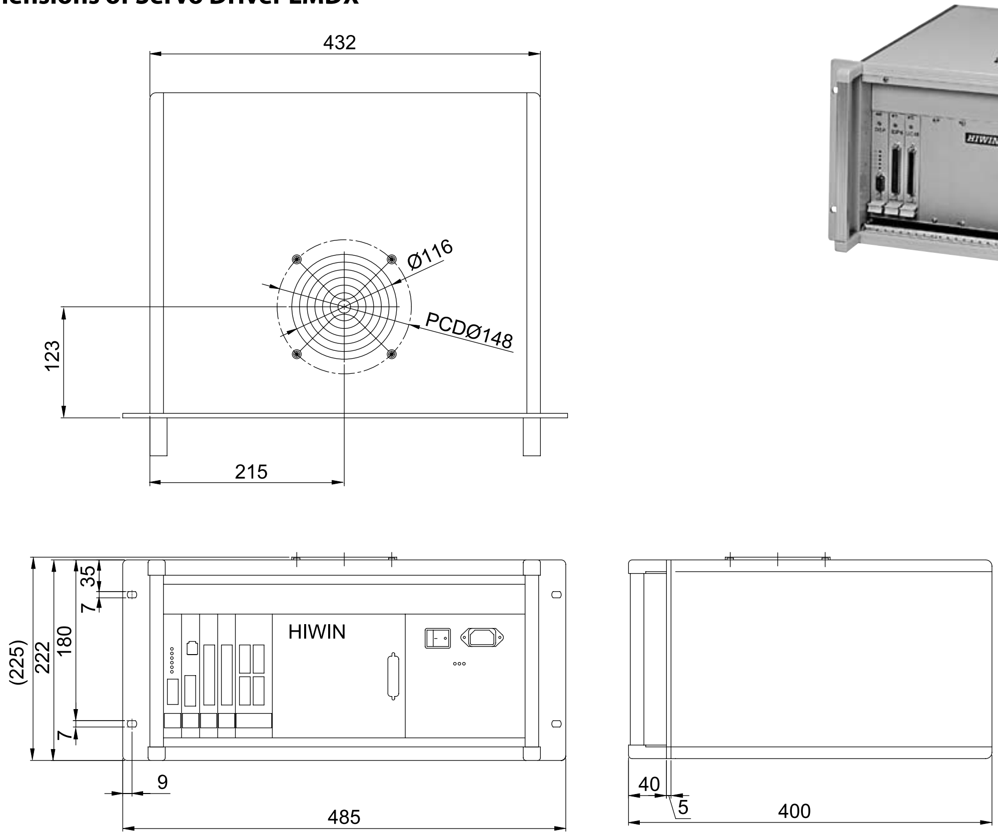

Table 3.3 Specifications for Servo Driver LMDX

		Unit	Value
Power supply	**Voltage**	V_{AC}	95-125 (LMDX1) 200-240 (LMDX2)
	Frequency	Hz	50/60
	Output	VA	500 (max.)
Output current		A	3 (max.)
Interface	**Parameter setting: RS-232**		9600 Baud, 8 data bits, 2 stop bits, odd parity
	Digital I/O signal		DXIO plug-in card: 8 inputs: including HOME and RESET 6 outputs: including IN-POSITION, ALARM, SVON DXIO16 plug-in card (option): 16 inputs, 16 outputs
	Pulse command	Pulse	STEP/DIR
Resolution		µm/pulse	min. 1 (set by parameter)
Mass		kg	13.3
Max. operation temperature		°C	50

4 Linear Motor Components

Positioning Systems

Linear Motor Components

4.1 Linear Motors, LMS Series

HIWIN synchronous linear motors LMS are the power packs of linear drives.
They are especially distinguished by very high power density and minimum cogging force.
The three-phase motors are composed of a primary part (forcer) with a coiled stack of sheets and a secondary part with permanent magnets (stators). With the combination of several stators, many stroke combinations are possible.

- 3-phase
- High thrust
- Excellent acceleration
- Low cogging
- Many stroke lengths
- Several forcers possible on one stator

4.2 Linear Motors, LMSC Series

HIWIN synchronous linear motors LMSC are iron-core motors with similar properties to the motors of the LMS series. Due to the special arrangement of the forcer between two stators, the attraction force in the LMSC motors is canceled. As a result, the guide rails are relieved of loads and a high power density is achieved with relatively short sliders.

- Large force constant
- Water cooling possible
- Attraction force compensation
- No attraction force introduction into the guide elements
- Several forcers possible on one stator
- Any stroke length

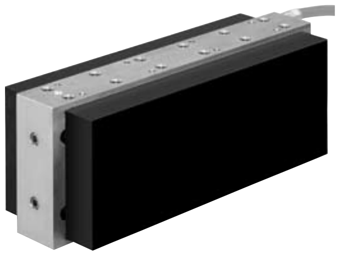

Table 4.2 **Specifications for Linear Motors, LMSC Series**

	Symbol	Unit	LMSC7	LMSC7(WC)[2]	LMSC7L	LMSC7L (WC)[2]

4.3 Linear Motors, LMC Series

4.3.1 Linear Motors, LMCA, LMCB, LMCC Series

HIWIN synchronous linear motors LMC are the born sprinters. They are light, extremely dynamic. This is due to their coreless primary part (forcer) with epoxy cast coils, it needs to move very little of its own weight. The secondary part is composed of an U-shaped stator made of permanent magnets.

- 3-phase
- Extremely dynamic
- Good synchronization and high speed consistency
- Low inertia and high acceleration
- Low profile
- No cogging
- Several forcers possible on one stator

Linear Motor Components

4.4 Linear Motors, LMF Series

HIWIN synchronous linear motors LMF are coiled stack of sheets with water-cooling loop. They are especial distinguished by very high power density and minimum cogging force. This three-phase motor is composed of a primary part (forcer) with iron core and secondary part (stator) with permanent magnets. With the combination of several stators, many stroke combinations are possible.

- 3-phase
- Water-cooling
- UL certification
- Low cogging
- Unlimited stroke

Linear Motor Components

4.5 Linear Motors, LMT Series

HIWIN Linear turbo LMT series are linear motors with the unique shape by arranging cylindrically permanent magnets. Due to the coreless forcer, the LMT Turbo motors are very light and extremely dynamic. They are also good substitutes for ballscrew applications, because of the same installation interface.

- 3-phase
- Low mass and high acceleration
- Extremely dynamic
- Wide air gap and easy assembly
- No cogging and no contact
- No wearing
- Multiple forcers

Effective stroke (S) = Magnets length (L_m) – Length of forcer (L_f)
Length of stator (L_s) = Magnets length (L_m) + Length of support (L_1) × 2

5 Torque Motor Rotary Tables

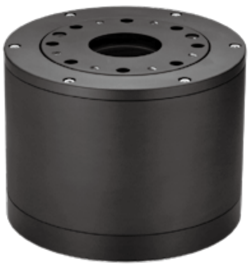
Positioning Systems
Torque Motor Rotary Tables

5.1 Product Overview and Application Areas

The extremely rigid connection between motor and load, and a servo-drive regulation ensures excellent acceleration capabilities and good uniformity of movement.
HIWIN rotary tables and torque motors are especially well suited for tasks in automation due to the hollow shaft design. Media, cable systems or mechanical parts can be fed through without problems.

HIWIN Rotary Tables:
TMS series utilize cross roller bearing.

- Drive free of clearance
- Hollow shaft
- No gear transmission losses
- Maintenance free and compact
- Driver can be selected freely
- Brush-free drive
- Extremely rigid support with cross-roller
- Meet IP65 enclosure standards as an option
- Integrated brake is available as an option



Short and compact:
HIWIN rotary tables are optimized for high torques and robust dynamics.

Table 5.1 Application Areas of Rotary Tables

Classification	Application	Features and main reasons for use					
		Accuracy	Speed	Rigidity	Compactness	Clearliness	Freedom from maintenance
Production equipment	CVD, wafer cleaning, ion implantation	○			○	○	○
	Semi-conductor transport, inspection/processing	○			○	○	○

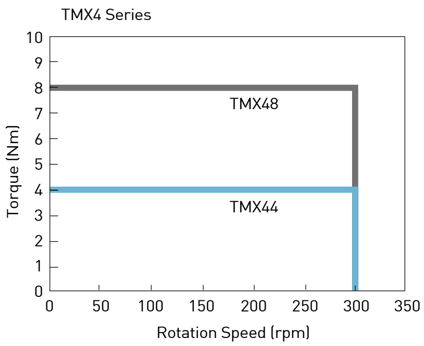
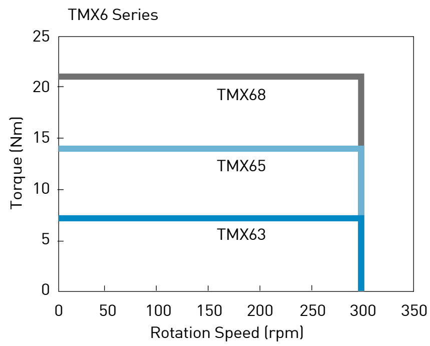
Torque to rotational speed curve



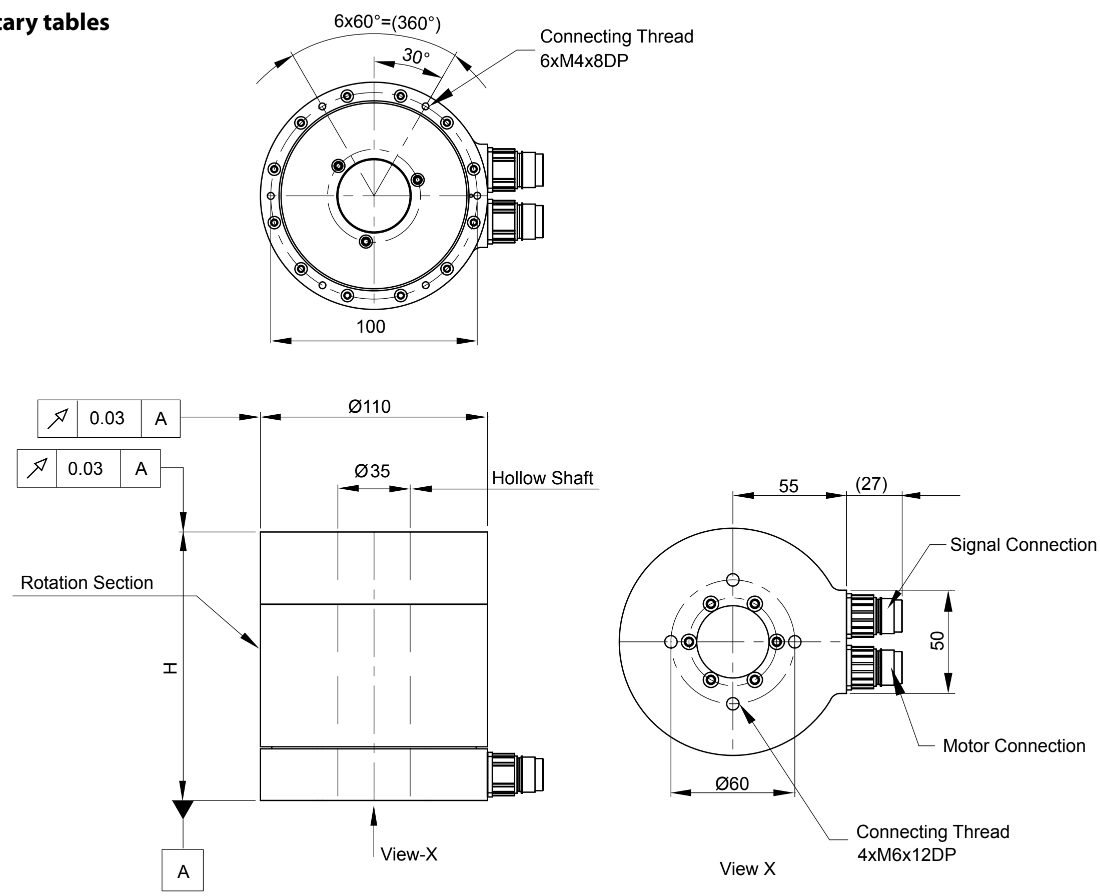


The torque to speed curve may vary from different types of driving systems. The curves showing below are base on Hiwin standard drivers (amplifiers).TMX4 series are driven by LMDR6 which is using 110V AC as input voltage. TMX6 is driven by Xenus driver which is using 220V AC as input voltage.

5.3.1 TMX4 Rotary Tables

Dimensions of TMX4 rotary tables

(Values see Table 5.6)



Positioning Systems

Torque Motor Rotary Tables

5.3.2 TMX6 Rotary Tables

Dimensions of TMX6 rotary tables
(Values see Table 5.6)

6 Control and Drivers

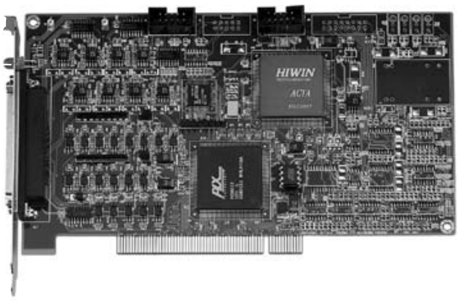
Positioning Systems

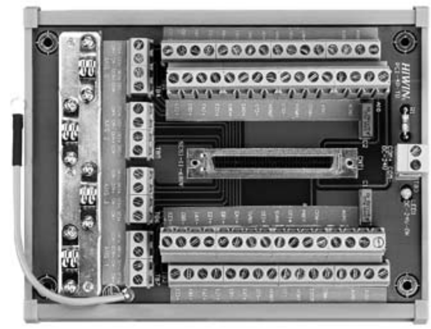
Control and Drivers

6.1 Control Card PCI4P

The HIWIN control card PCI4P controls a driver with up to four axes. It can be used for stepping motors and for pulse-controlled servo motors.

- 32 bit PCI card, Plug-and-Play
- Pulse train generation for 4 axes
- 13 digital inputs, 5 digital outputs
- Supports STEP/DIR, CW/CCW and A/B phase pulse format
- Differential pulse output reduces noise interference
- Linear interpolation for three axes
- Circular interpolation for two axes
- Supports speed profile T and S
- 4 x 32 bit counter for digital incremental encoder (Max. 1.76MHz after 4x evaluation)
- Encoder latch function
- DLL driver library for Windows, MCCL Motion Library for VC++/ VB programming under Windows XP with 98 functions
- Referencing, limit switch, jog function
- Supports stepping motors, AC servo motors and linear motors
- MotionMaker™ user interface for convenient operation
- Power supply slot
  +5 V DC +/–5 %, max. 900 mA via PCI-Bus in PC
- External power supply (input)
  +24 V DC +/–5 %, max. 500 mA, prepared by user



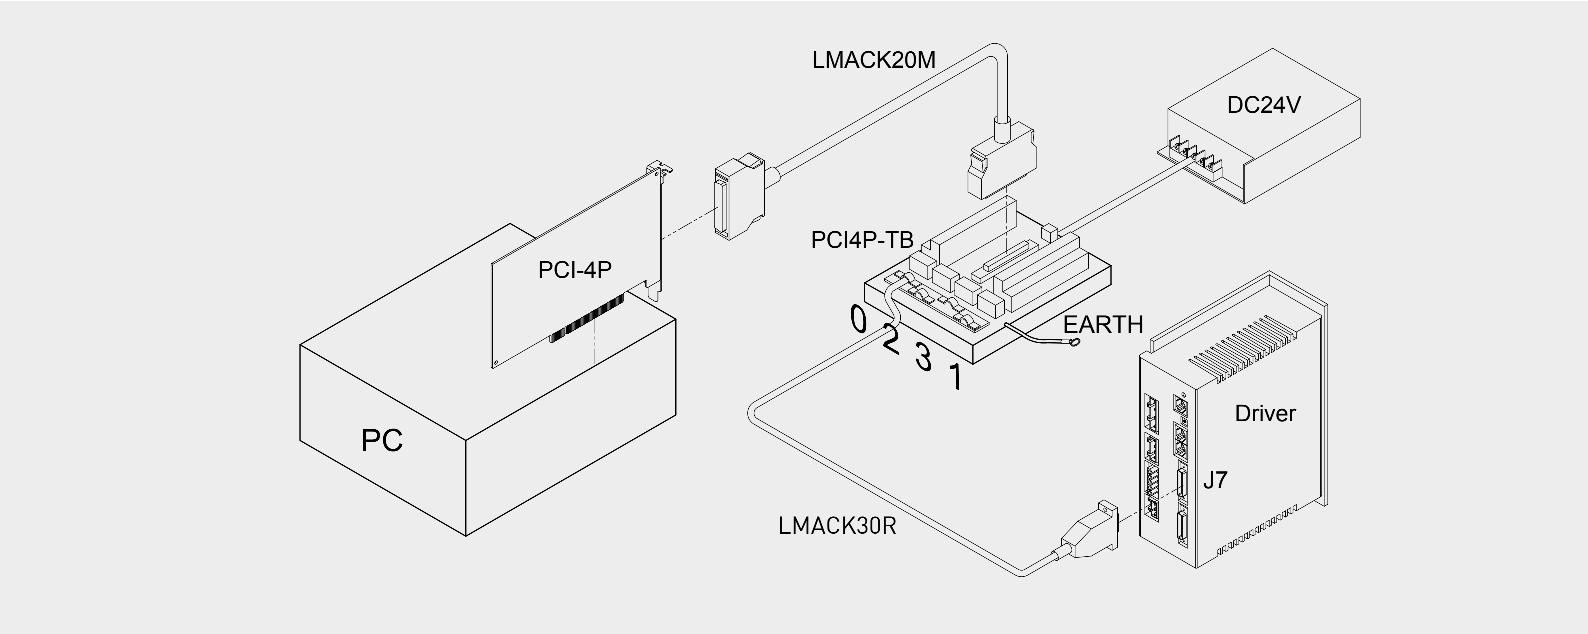


6.1.1 Terminal Block PCI4P-TB

The terminal block PCI4P-TB provides clear connection options for pulse generators and all inputs and outputs of the control card.

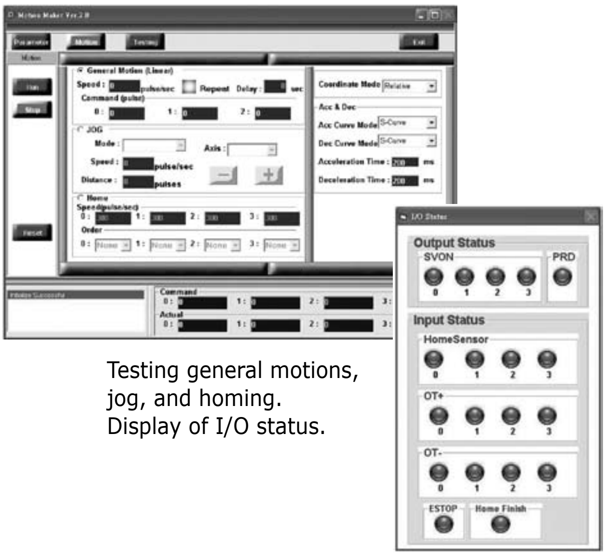
Applicable for stepping motor,
AC servo motors and linear servo motors etc.

Connection example

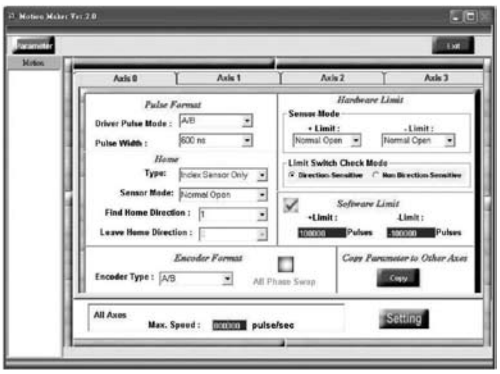


HIWIN Motion Maker

HIWIN Motion Maker tool software is easy to use for the first step of building a motion system with PCI-4P. With its help, a user can check if the wiring and logic of switches are satisfactory and make test runs.



Testing general motions,
jog, and homing.
Display of I/O status.



Pulse formats, Homing,
Hardware and software limits.

Positioning Systems

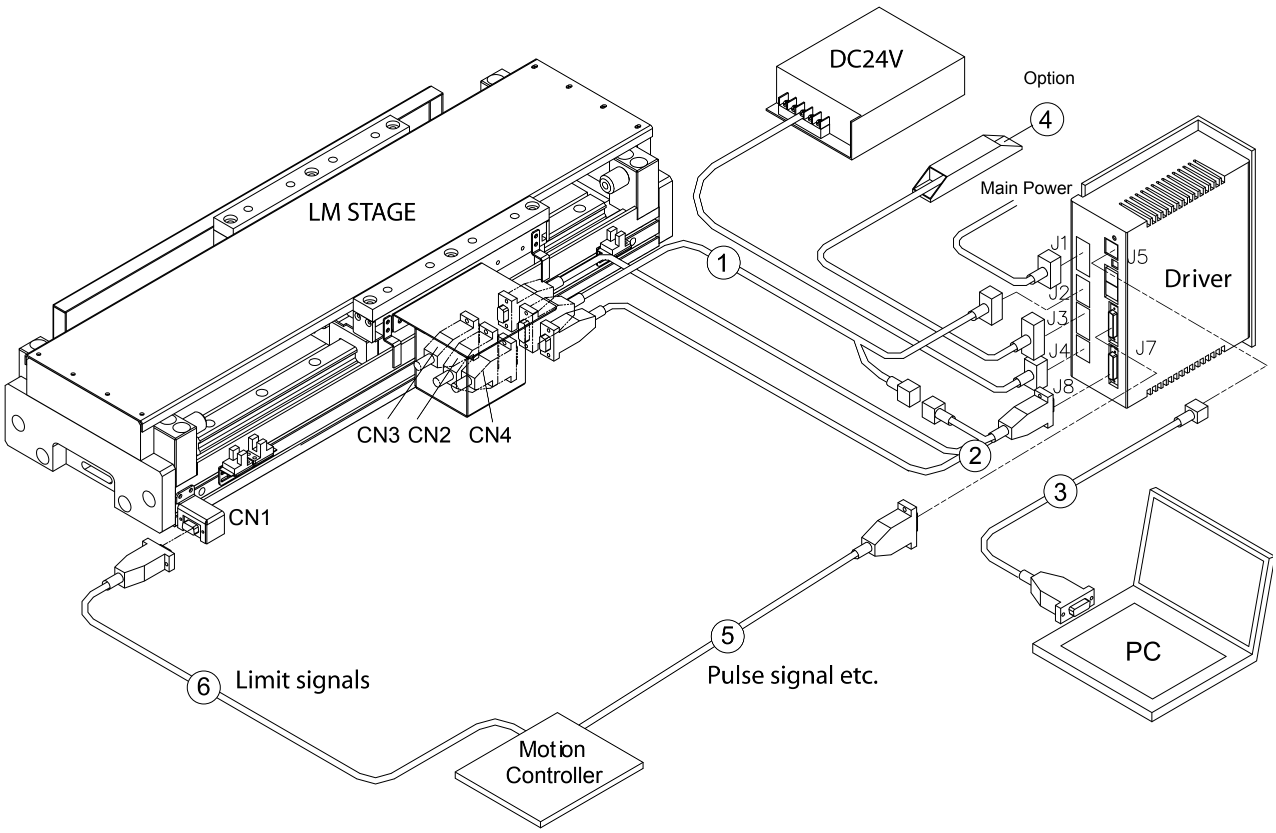
Control and Drivers

6.2 Drivers

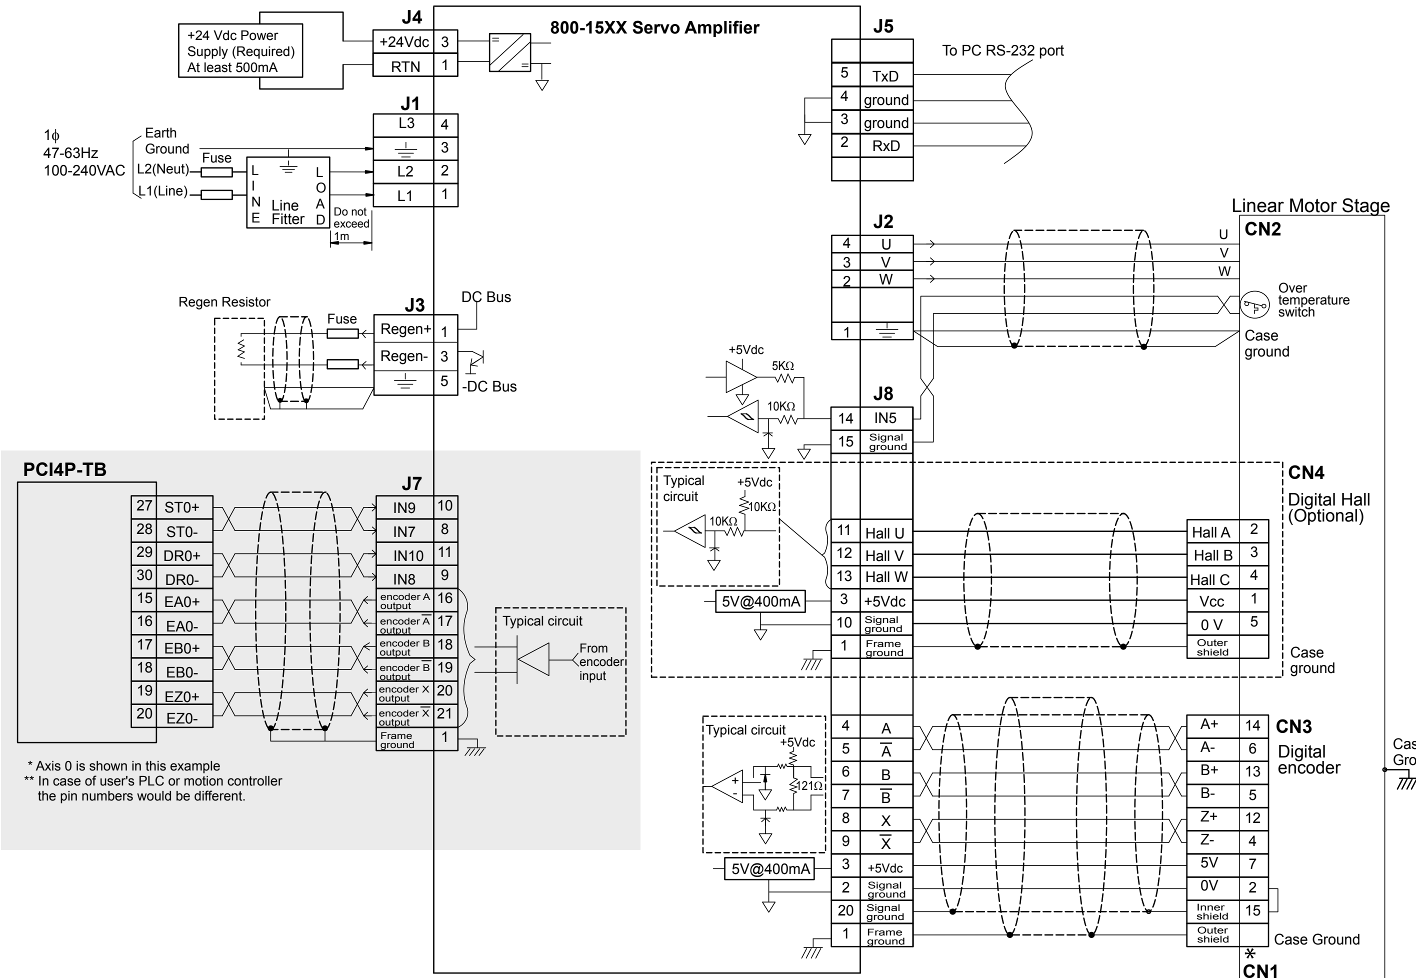
6.2.1 Drivers for Linear Motor Stages

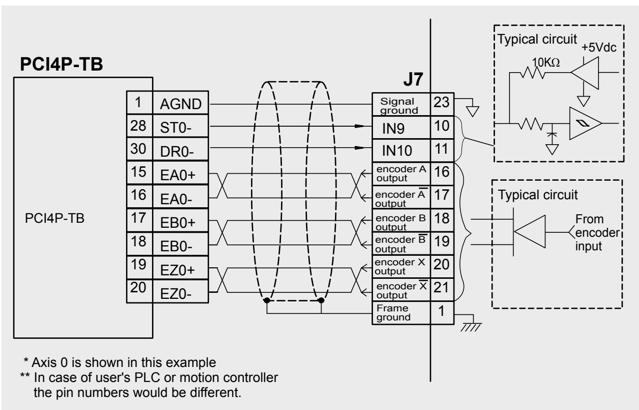
800-15XX Servo Driver

- Digital amplifier
- Field oriented control
- Intuitive CME2 interface
- 100-240VAC input power
- CANopen
- Step/Direction
- Indexer
- Support analog and digital encoder



Wiring examples





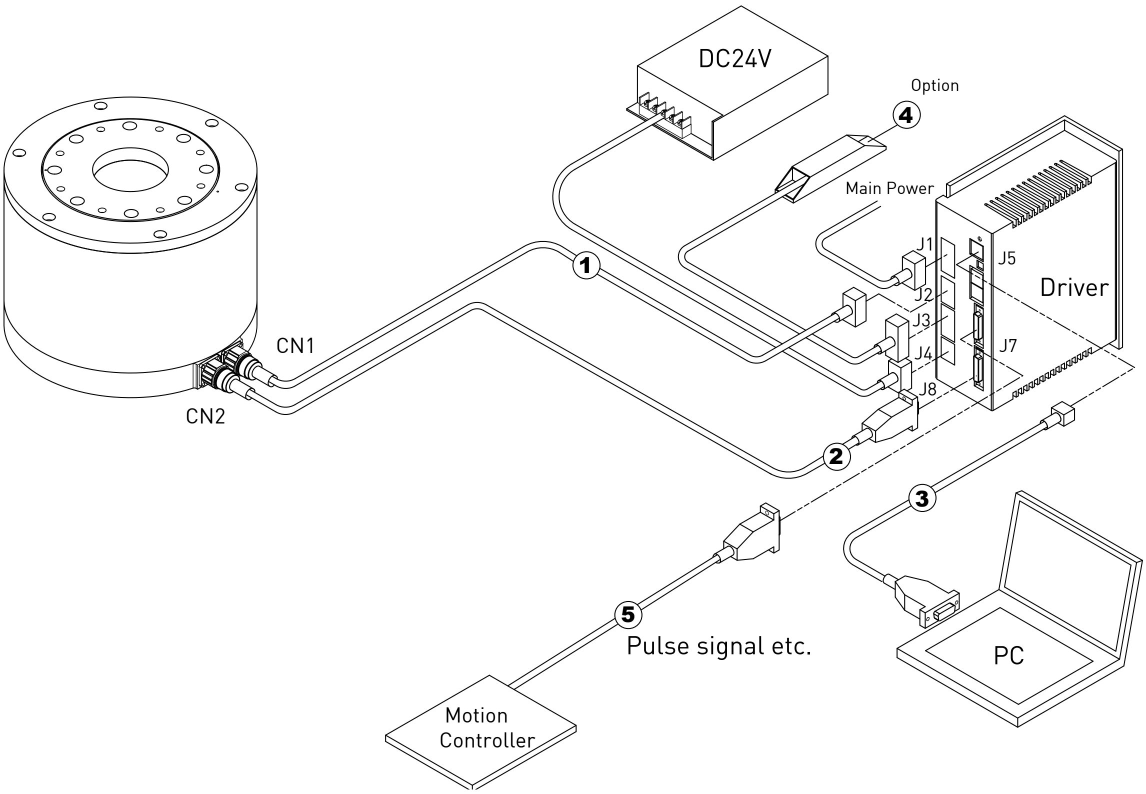
Note: For XSL-230. All other connections, same as 800-15XX.

Positioning Systems
Control and Drivers

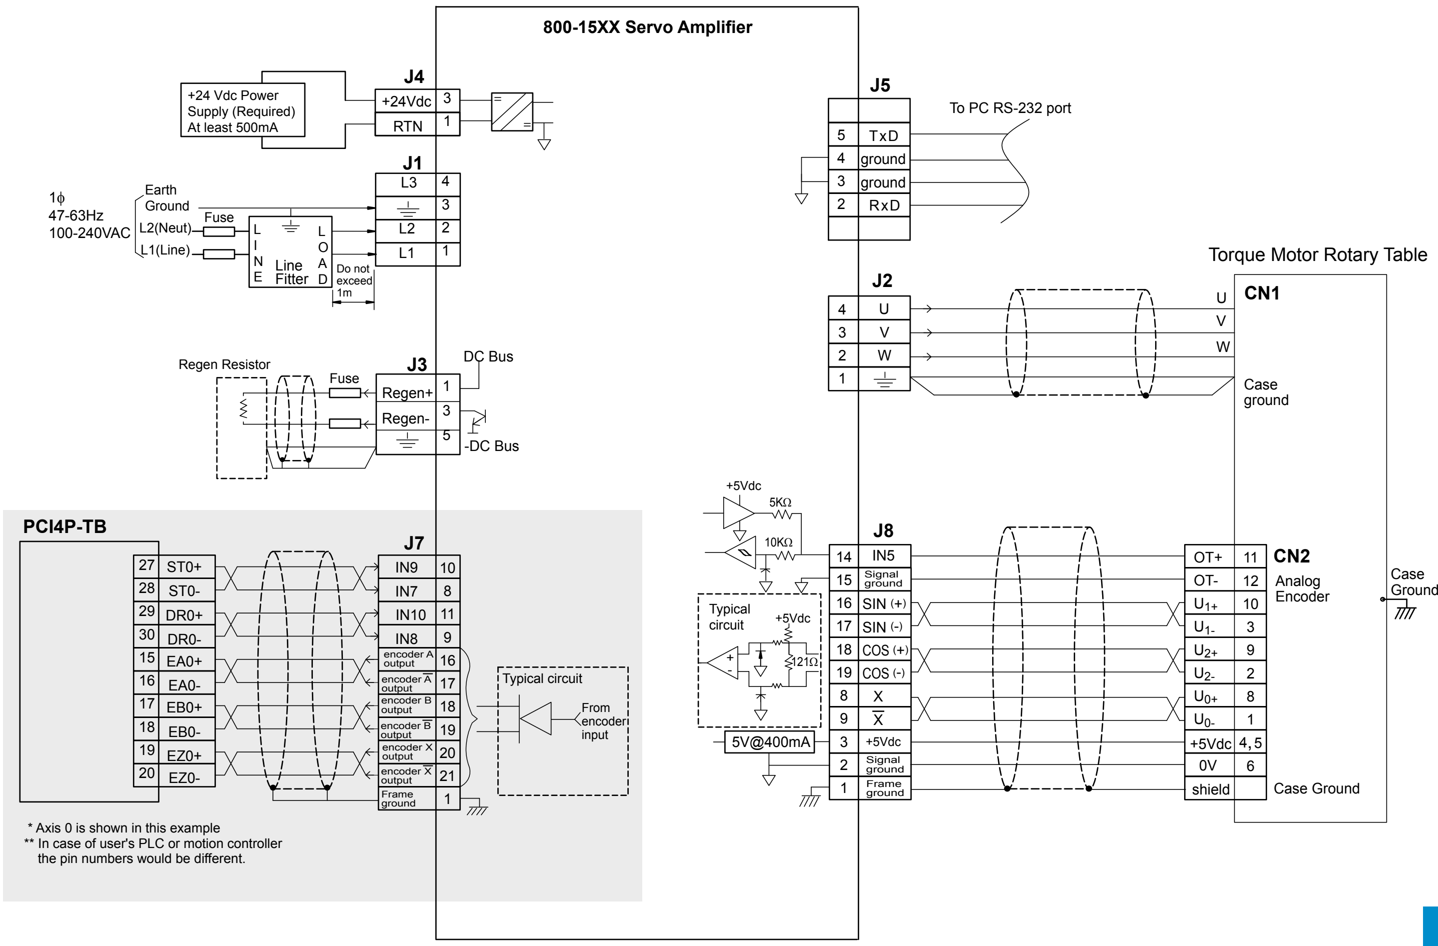
6.2.2 Drivers for Rotary Tables

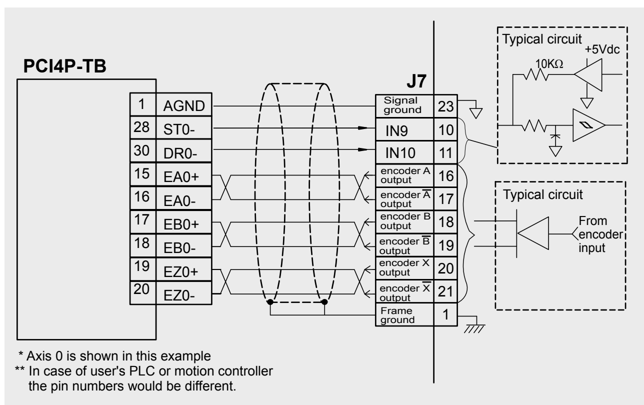
800-15XX Servo Driver

- Digital amplifier
- Field oriented control
- Intuitive CME2 interface
- 100-240VAC input power
- CANopen
- Step/Direction
- Indexer
- Support analog and digital encoder



Wiring examples





Note: For XSL-230. All other connections, same as 800-15XX.

Positioning Systems

Appendix A: Motor Sizing

Start Motor Sizing

The following contents describe how to choose proper motor according to speed, moving distance, and loading inertia. The basic process for sizing a motor is:

- Decide motion profile and required parameters
- Calculate peak and continuous force
- Select motor

Symbols

X : move distance (mm)
T : move time (sec)
a : acceleration (mm/s^2)
V : velocity (mm/s)
M_L: loading (kg)
g : gravitation acceleration (mm/s^2)
F_p : peak force (N)
F_c : continuous force (N)
F_a : attraction force between stator and forcer (applicable for LMS, LMF series) (N)
F_i : inertia force (N)
K_p : force constant (N/Arms)
I_p : peak current (Arms)
I_e : effective current (Arms)
I_c : continuous current (Arms)
V_0 : starting velocity (mm/s)

STEP 1 Decide motion velocity profile and required parameters

In order to determine the correct motor for a particular application it is necessary to be familiar with the motion equation.

Motion equation

Basic kinematics equations are described as follows:

$$V = V_0 + aT$$

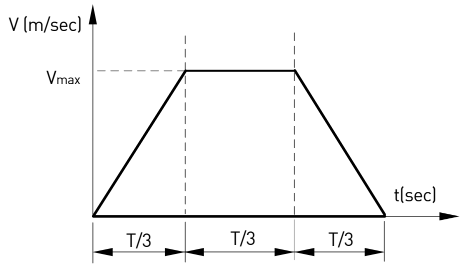
$$X = V_0T + \frac{1}{2}aT^2$$

Where V is velocity, a is acceleration, T is move time and X is move distance.
You can choose two of the four parameters (V, a, T and X) as your designed parameters, then the last two parameters can be calculated by above equations.

Motion velocity profile

1. 1/3-1/3-1/3 trapezoid profile

If the distance (X) and move time (T) have been given, the most common and efficient velocity profile for point-to-point motion is the "1/3-1/3-1/3" trapezoid curve because it provides the optimal move by minimizing the power required to complete the move. It breaks the time of the acceleration, traveling, and deceleration into three segments as shown below.



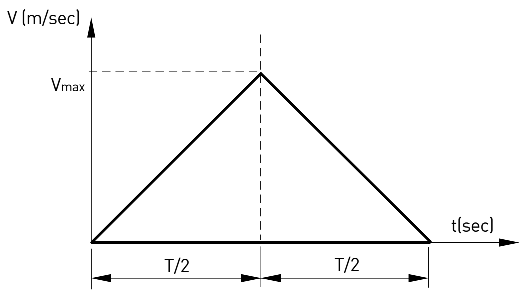
$$V_{max} = 1.5 \times \frac{X}{T} \quad (\text{Because } X = \frac{V}{2} \times \frac{T}{3} + V \times \frac{T}{3} + \frac{V}{2} \times \frac{T}{3})$$

$$a_{max} = \frac{V_{max}}{T/3} = \frac{4.5X}{T^2}$$

Herein the parameters are described as motion equation.

2. 1/2-1/2 triangle profile

If X and T are given, another common motion profile is the 1/2-1/2 triangle profile. The motion is divided into two parts, namely acceleration and deceleration. The second motion velocity profile is shown as follows.



$$V_{max} = 2 \times \frac{X}{T}$$

$$a_{max} = \frac{4X}{T^2}$$

The acceleration required in the first motion velocity profile is bigger than that in the second motion velocity profile; therefore, the required motor size is bigger. When choosing second motion velocity profile, the chosen motor size is smaller, however, we need to verify the DC bus of driver is bigger enough, due to the higher velocity (V_{max}).

3. Some useful equations

	1/3 -1/3-1/3 Trapezoid profile	Triangle profile
		V	$1.5 \times \frac{X}{T}$	$2 \times \frac{X}{T}$, or $\sqrt{a \times X}$
a	$\frac{4.5X}{T^2}$	$\frac{4X}{T^2}$
t	$\frac{X}{V_{max}} + \frac{V_{max}}{a}$ (if $\frac{X}{V_{max}} \geq \frac{V_{max}}{a}$)	

STEP 2 Determine peak force and effective force

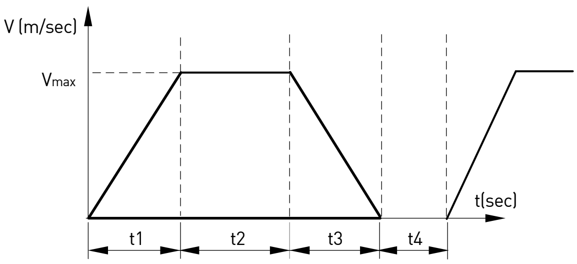
The peak force can be calculated by the follow equation

$$F_p = M_L \times a_{max} + (M_L \times g + F_a) \times \mu = F_i + F_f$$

Where F_i is inertia force while F_f is friction force, and μ is friction factor.

In most cases, motions are cyclic point-to-point movements. Assuming a cyclic motion shown in the following profile with a pause time of t_4 second, the effective force can be calculated as following formula:

$$F_e = \sqrt{\frac{(F_i + F_f)^2 t_1 + F_f^2 t_2 + (F_i - F_f)^2 t_3}{t_1 + t_2 + t_3 + t_4}}$$



The peak current I_p and effective current I_e can be calculated by using motor force constant K_f.

$$I_p = \frac{F_p}{K_f}$$

$$I_e = \frac{F_e}{K_f}$$

STEP 3 Select motor by peak force and verify the current supply of motor

From the catalog of HIWIN, you can check the specifications of motor and choose an applicable motor by peak force, and then you can verify the current supply if it is fitted the specification as follows.

$$I_p = \frac{F_p}{K_f} < I_p \text{ (from specification of chosen motor)}$$

$$I_e = \frac{F_e}{K_f} < I_c \text{ (from specification of chosen motor)}$$

Regarding effective and continuous current, the ratio of I_e/I_c had better be less than 0.7 to attain some margin.

Positioning Systems

Linear Motor Sizing Example

For example, if load is 5 kg (moving mass of mechanism is 1 kg and payload is 4 kg), friction factor μ is 0.01 ,distance is 500 mm, move time is 400 ms and dwell time is 350 ms.

At first, we can calculate the V_{max}, a_{max}, F_p and F_e by the formulas described above (choose the first motion velocity profile and LMC series)

$$V_{max} = 1.5 \times \frac{X}{T} = 1.5 \times \frac{0.5}{0.4} = 1.875 \text{ (m/sec)}$$

$$a_{max} = \frac{4.5 \times X}{T^2} = \frac{4.5 \times 0.5}{(0.4)^2} = 14.06 \text{ (m/sec}^2\text{)}$$

$$F_p = M_L \times a_{max} + (M_L \times g + F_a) \times \mu$$

$$= 5 \times 14.06 + 5 \times 9.81 \times 0.01 = 70.3 + 0.49 = 70.79 \text{ (N)}$$

$$F_e = \sqrt{\frac{\left[(70.3 + 0.49)^2 + 0.49^2 + (70.3 - 0.49)^2\right] \times 0.1333}{0.4 + 0.35}}$$

$$= 41.92 \text{ (N)}$$

In this case, we can choose motor of type LMCA6 (p.48) which can provide up to 187(N)of peak force and continuous force 62(N), and the force constant is 33.8 N/A(rms). Then the current supply of motor can be determined as follows

$$I_p = \frac{F_p}{K_f} = \frac{70.79}{33.8} = 2.09 \text{ (Arms)} < 5.4 \text{ (Arms)}$$

$$I_p = \frac{F_e}{K_f} = \frac{41.92}{33.8} = 1.24 \text{ (Arms)} < 1.8 \text{ (Arms)}$$

$$I_e / I_c = \frac{1.24}{1.8} \times 100\% = 68.89\% < 70\%$$

Appendix B: Sizing a Regen Resistor

1. Gather required information
To calculate the power and resistance of the regen resistor requires information about the amplifier and the motor. For all applications, gather the following information:

- Detail of motion profile, including acceleration and velocity
- Amplifier model number
- Applied line voltage to amplifier
- Toque/force constant of the motor
- Resistance (line-to-line) of the motor windings

For rotary motor applications, gather additional information
- Load inertia seen by the motor
- Inertia of the motor

For linear motor applications, gather additional information
- Moving mass

2. Observe the properties of each deceleration during a complete cycle of operation
For each deceleration during the motion cycle, determine:
- Speed at the start of the deceleration
- Speed at the end of the deceleration
- Time over which the deceleration takes place

3. Calculate energy returned for each deceleration
The energy returned during each deceleration can be calculated by the following formulas.
Rotary motor:

$$E_{dec} = \frac{1}{2} J_t (\omega_1^2 - \omega_2^2)$$

E_{dec} (joules): Energy returned by the deceleration
J_t (kg m^2): Load inertia on the motor shaft plus the motor inertia
ω_1 (radians /sec): Shaft speed at the start of deceleration
ω_2 (radians /sec): Shaft speed at the end of deceleration
I_e : effective current (Arms)

Linear motor:

$$E_{dec} = \frac{1}{2} M_t (V_1^2 - V_2^2)$$

E_{dec} (joules): Energy returned by the deceleration
M_t (kg): Moving mass
V_1 (meters /sec): Velocity at the start of deceleration
V_2 (meters /sec): Velocity at the end of deceleration

4. Determine the amount of energy dissipated by the motor
Calculate the amount of energy dissipated by the motor due to current flow through the motor winding resistance using the following formula.

$$P_{motor} = \frac{3}{4} R_{winding} (\frac{F}{K_t})^2$$

P_{power} (watts): Power dissipated in the motor
$R_{winding}$ (ohm): Line to Line resistance of the motor coil
F : Force need to decelerate the motor
Nm for rotary applications
N for linear applications
K_t: Torque constant for the motor
Nm/Amp for rotary applications
N/Amp for linear applications
$E_{motor} = P_{motor} T_{decel}$
E_{motor} (joules): Energy dissipated in the motor
T_{decel} (seconds): Time of deceleration

5. Determine the amount of energy returned to the amplifier
Calculate the amount of energy that will be returned to the amplifier for each deceleration using the following formula

$E_{returned} = E_{dec} - E_{motor}$
$E_{returned}$ (joules): Energy returned to the amplifier
E_{dec} (joules): Energy returned by the deceleration
E_{motor} (joules): Energy dissipated by the motor

6. Determine if energy returned exceeds amplifier capacity
Compare the amount of energy returned to the amplifier in each deceleration with the amplifier's absorption capacity. The following formula is used to determine the energy that can be absorbed by the amplifier.

$$W_{capacity} = \frac{1}{2} C (V_{regen}^2 - (1.414 V_{mains})^2)$$

$W_{capacity}$ (joules): The energy that can be absorbed by the bus capacitor
C (farads): Bus capacitance
V_{regen}(volts): Voltage at which the regen circuit turns on
V_{mains}(volts): Mains voltage (AC) applied to the amplifier

7. Calculated energy to be dissipated for each deceleration
For each deceleration where the energy exceeds the amplifier's capacity, using the following formula to calculate the energy that must be dissipated by the regen resistor.

$E_{regen} = E_{returned} - E_{amp}$
E_{regen} (joules): Energy that must be dissipated in the regen resistor
$E_{returned}$ (joules): Energy delivered back to the amplifier from the motor
E_{amp} (joules): Energy that the amplifier will absorb

8. Calculate pulse power of each deceleration that exceeds amplifier capacity
For each deceleration where energy must be dissipated by the regen resistor, use the following formula to calculate the pulse power that will be dissipated by the regen resistor

$P_{pulse} = E_{regen} / T_{decel}$
P_{pulse} (watts): Pulse power
E_{regen} (joules): Energy that must be dissipated in the regen resistor
T_{decel} (seconds): Time of deceleration

9. Calculate resistance needed to dissipate the pulse power
Using the maximum pulse power from the previous calculation, calculate the resistance value of the regen resistor required to dissipate the maximum pulse power.

$R = V^2_{regen} / P_{pulse\ max}$
R(ohms):Resistance
$P_{pulse\ max}$:The maximum pulse power
V_{regen} :The voltage at which the regen circuit turns on

Positioning Systems

Choose a standard value of resistance less than the calculated value. The value must also be greater than the minimum regen resistor value specified by the amplifier supplier.

10. Regen resistor sizing example

Gather required information

LM ROBOTS type:LMXL1L-S37L-1200-G200

Amplifier: 800-1513A

DC bus capacitance: 1760μF

Regen circuit turn on voltage: 390V

Minimum resistance:15Ω

Moving mass: 86Kg (include payload 74 Kg)

V_{max}: 2 m/s

Acceleration, deceleration: 5 m/s^2

Power supply (AC) of driver: 220VAC

Motor type:LMS37L

Force constant (Kf): 68N/A(rms)

$R_{winding}$: 2 ohms(line-to-line)

Calculate regen resistor as following step:

$$F = ma = 86 \times 5 = 430\,(N)$$

$$E_{dec} = \frac{1}{2} m_t V^2 = \frac{1}{2} \times 86 \times 2^2 = 172(\text{joule})$$

$$P_{motor} = \frac{3}{4} \times R_{winding} \times (\frac{F}{K_f} \times \sqrt{2})^2 = \frac{3}{4} \times 2 \times (\frac{430}{68} \times \sqrt{2})^2$$
$$= 120\,(\text{Watt})$$

$$E_{motor} = P_{motor} \times T_{decel} = 120 \times (\frac{2}{5}) = 48\,(\text{joule})$$

$$E_{returned} = E_{dec} - E_{motor} = 172 - 48 = 124\,(\text{joule})$$

$$W_{capacity} = \frac{1}{2} \times C \times (V_{regen}^2 - (1.414 V_{mains})^2)$$
$$= \frac{1}{2} \times 1760 \times 10^{-6} \times (390^2 - (1.414 \times 220)^2)$$
$$= 48.7\,(\text{joule})$$

$$\because E_{returned} > W_{capacity}$$

$$E_{regen} = E_{returned} - E_{amp} = 124 - 48.7 = 75.3\,(\text{joule})$$

$$P_{pulse} = E_{regen} / T_{decel} = 75.3/0.4 = 188.25\,(\text{Watt})$$

$$R = \frac{V_{regen}^2}{P_{pulse}} = \frac{390^2}{188.25} = 807.97(\text{ohms})$$

Because the total value of selected resistance must be less than 807.97 ohms and the power capacity must be more than 188.25 watts, we choose two resistors and connect them in series, in each resistor the resistance is 68 ohms and power capacity is 100W. The total resistance value is 136 ohms and power capacity is 200W. The resistance order number is 050100700001.
